Geography and Climate of the Caribbean

Overview of the Caribbean Geographical Regions

The Caribbean is typically divided into several geographical regions, each with distinct characteristics. These regions include the Greater Antilles, the Lesser Antilles, and the Bahamas. The Greater Antilles consists of the larger islands such as Cuba, Jamaica, Puerto Rico, and Hispaniola. On the other hand, the Lesser Antilles comprises a chain of smaller islands stretching from the Virgin Islands down to Trinidad and Tobago.

The Bahamas, while often associated with the Caribbean, is technically an archipelago located north of the Greater Antilles. This geographical diversity contributes to the varying climates and ecosystems found throughout the region, ranging from tropical rainforests to arid landscapes.

Climate Variations Across the Islands

The climate in the Caribbean is predominantly tropical, characterized by warm temperatures and seasonal rainfall. However, there are variations in climate depending on the specific island and its location. For example, the eastern Caribbean islands, such as Barbados and Saint Lucia, experience a more humid climate due to the trade winds, while the western Caribbean islands, like Mexico's Yucatán Peninsula, can be influenced by both tropical and subtropical conditions.

The Caribbean also experiences a wet season and a dry season. The wet season typically runs from May to November, coinciding with the Atlantic hurricane season, while the dry season spans from December to April. This seasonal variation greatly affects tourism and agricultural practices across the islands.
